## **DETAILED ACTION**

## Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).
- 3. Claims 1-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ogata (002) in view of Dmitriev (873).

Ogata (002) discloses in Figure 11 an ion implantation device comprising: an ion source: mass spectrometer (2); a slit (4); a first scanning, electromagnet (6) (claim1); and a second, correction electromagnet(s) disposed downstream of said first scanning, electromagnet to compensate/correct for the ion beam angle (claim 2).

Although the power/current sources to said first and second electromagnets are not shown in Ogata (002), they are assumed to be present in altering the strength of

Application/Control Number: 09/756,922 Page 3

Art Unit: 2881

said magnetic fields according to their specific function. Such power/current source means can further be seen in a similar electron beam irradiation device to Dmitriev (873). For example, Dmitriev (873) discloses in col.5, first paragraph that scanning electromagnet 30 is connected to a generator 33 and the correcting electromagnet 31 is connected to a current source 38. Note that the "correcting electromagnet 31 being connected electrically in series and **in opposition** and coupled to direct current source 38", seems to imply that the correcting electromagnet is 180 degrees out of phase to said first electromagnet.

Hence, it would been obvious to one of ordinary skill in the art that not only can there be two electromagnets (scanning & correcting) in series prior to ion implantation wafer, but the second correcting electromagnet may be connected to another power/current source, such that the second electromagnet is in opposition to said second and is out of phase, as broadly taught by said secondary reference.

## Conclusion

- 4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Olson (Figure 1), White, Benveniste, Mobley, Aitken (col.7, lines 43-46) have been cited to show other similar devices.
- 5. The lengthy specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.
